REASONS FOR ALLOWANCE

1. The amendment filed 9/10/2007 has been entered. Claims 1-8 are pending in this Office action.

Allowable Subject Matter

2. Claim 1-8 are allowed.

3. The following is a statement of reasons for the indication of allowable subject matter: the present invention comprises a wireless communication system and method comprising: a transmitter including an orthogonal encoder for converting serially input binary signals to parallel binary signals and orthogonally encoding the parallel binary signals, a first multiplier for multiplying the orthogonally encoded binary signals by an intrinsic spreading code to spread the orthogonally encoded binary signals, and an OFDM (Orthogonal Frequency Division Multiplexing) modulator for OFDM-modulating the spread signals; and a receiver including an OFDM demodulator for demodulating the OFDM-modulated signals, and a maximum likelihood detector for performing a maximum likelihood detection of the demodulated spread signals, the maximum likelihood detector grouping the OFDM-demodulated signals into a predetermined number of blocks, and performing maximum likelihood detection for each of the blocks to get a predetermined number of maximum likelihood detection values, performing maximum likelihood detection for all the predetermined number of maximum likelihood detection values. The closest prior art, Schreiber et al. (US 5,425,050) disclose the similar system which include a transmitter including an orthogonal encoder for converting serially input binary signals to parallel binary signals and orthogonally

encoding the parallel binary signals, a first multiplier for multiplying the orthogonally encoded binary signals by an intrinsic spreading code to spread the orthogonally encoded binary signals, and an OFDM (Orthogonal Frequency Division Multiplexing) modulator for OFDM-modulating the spread signals; and a receiver including an OFDM demodulator for demodulating the OFDM-modulated signals, and a maximum likelihood detector for performing a maximum likelihood detection of the demodulated spread signals (see figures 3 and 4). However, Schreiber et al. fail to teach the maximum likelihood detector grouping the OFDM-demodulated signals into a predetermined number of blocks to perform the maximum likelihood detection, and using the grouped maximum likelihood detection values to perform a whole maximum likelihood detection. The distinct features have been added to the independent claims 1 and 5, therefore, rendering them allowable.
